

Initial Design for Home Page & Notification Settings Page:

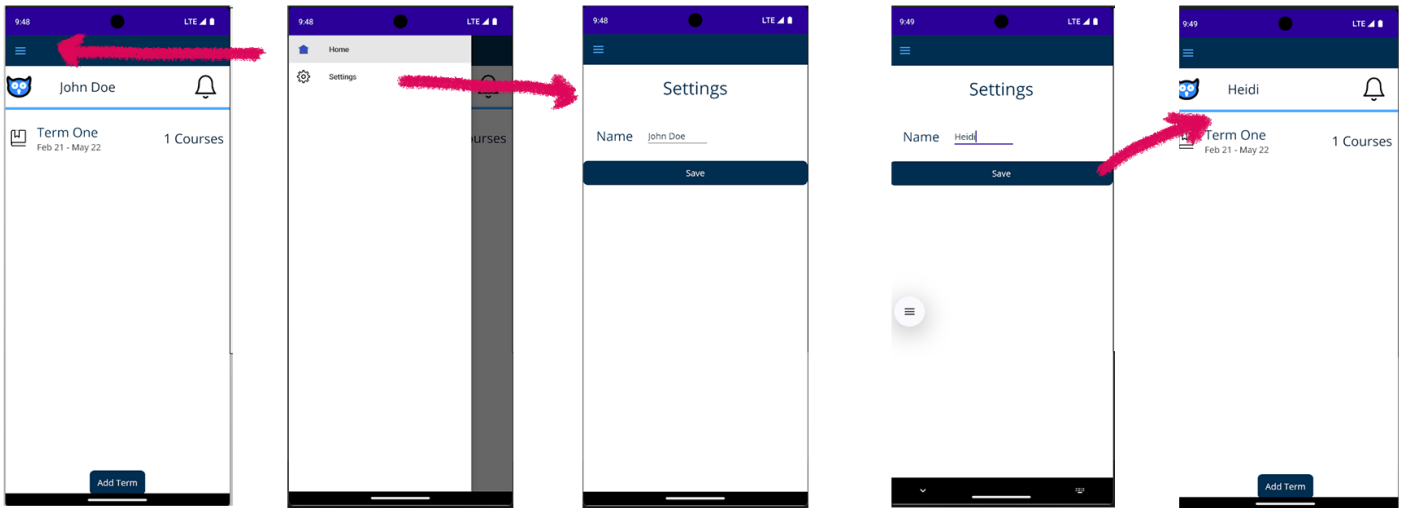

Notes on design updates after application development:

I ended up making a few changes to the Home and Notification Settings Pages. First, I implemented a hamburger menu at the top instead of the 'Home' and 'Notifications' buttons at the bottom of the screen. I did this to capitalize on the available screen real estate and allow more terms to be displayed. I renamed the Notification Settings page to simply "Settings" Page. Instead of giving users the ability to update the Student Name from the Home Page, I moved this function to the 'Settings' page and removed the unnecessary "Student" label. This helps to give more space on the Home Screen for managing the terms.

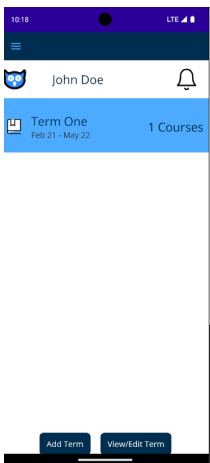

Notifications are no longer handled from the settings page. This is to more closely adhere to the given requirements for this app. Instead, I implemented notification settings per item. For example, instead of toggling notifications for all terms in the settings page, each individual term has its own notification toggle button.

Instead of clicking or double clicking a term to enter the term details page, I added a button to appear once a term is selected to facilitate the interaction on both windows and mobile.

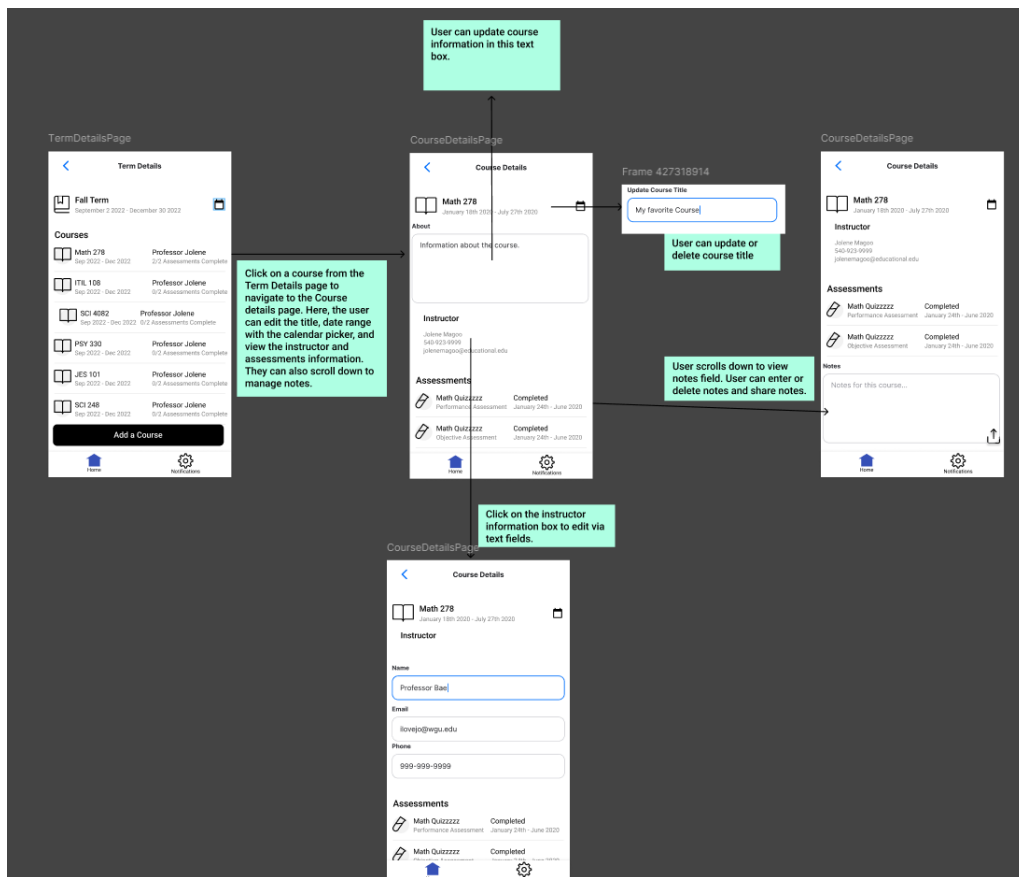

Images of final design for the 'Home' and 'Settings' (Replacing Notification Settings) Page :

Final design for selection of a term and navigation via a new View/Edit button. NOTE: This pattern is repeated for courses and assessments.

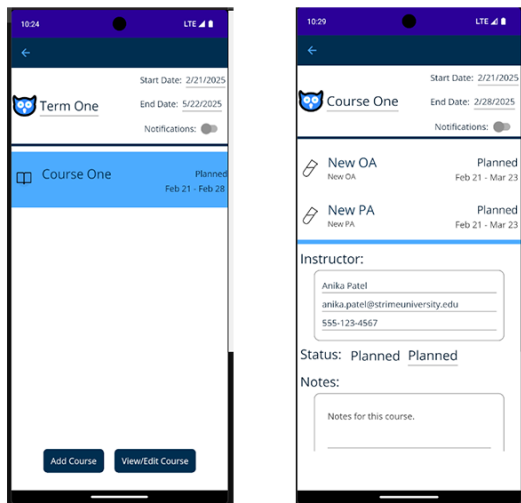

Initial Design for Term Details Page and Course Details Page:

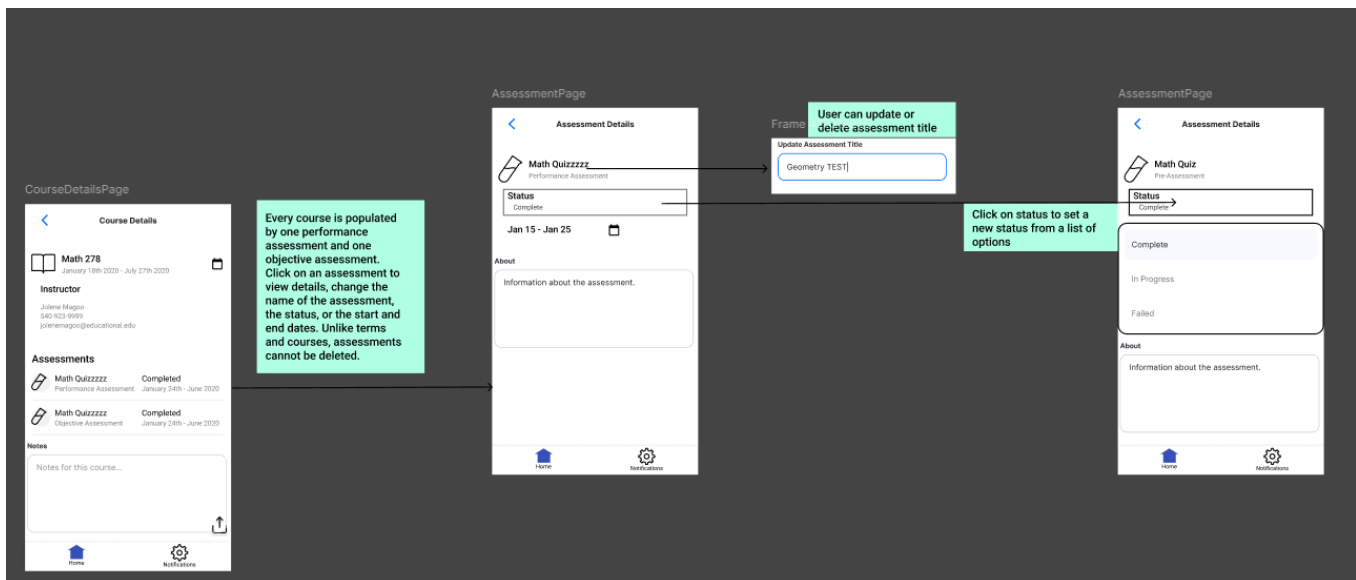

Notes on design updates after application development:

I simplified some of the page details to be less overwhelming to users. For example, on the term page I removed the preview of the instructor's name from the listed courses as well as the number of assessments completed per course. I replaced this information with the more helpful course status and course start/end dates. As mentioned in the previous section, a notifications toggle was also added to these pages to allow users to manage notifications on an individual basis. A slight re-ordering of sections in the course page was made to enhance readability. The need to click on a box to change instructor data was removed to simplify the process.

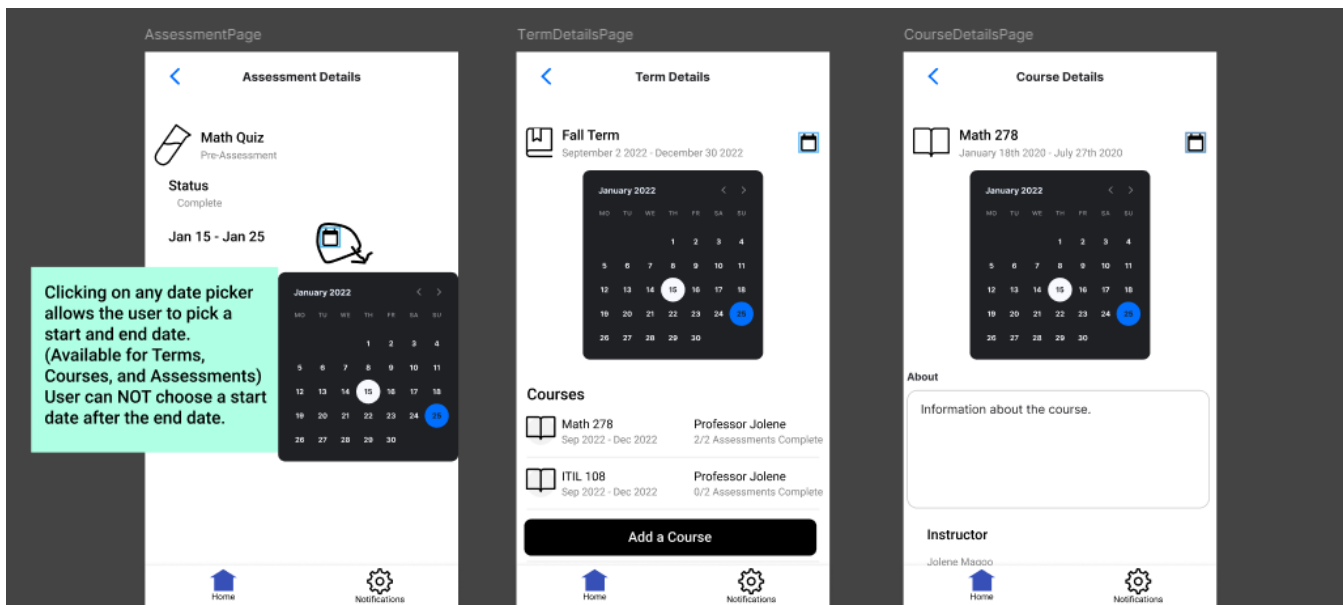

Final Design for Term Details Page and Course Details Page:

Initial Designs of Course Details Page to Assessment Details Page flow and details:

Example of using the date picker to set dates for Terms, Courses, and Assessments:

Final Post Development Note:

The only changes to the remaining, initial designs have already been mentioned. Namely, the addition of a view/edit button for the selection of a course while in a term details page and the selection of an assessment while in the course details page. Please see the Home Details page final image for an example of this.

Any other visual differences are due to the way .NET Maui controls are implemented on the individual platforms (Windows, Android, and iOS.)
